

Practical No. 12 Implementing Validation Checks and Regression Testing**Date:** _____**Aim:**

To learn how to perform validation checks and regression testing.

Theory:

Validation Checks: Validation checks are tests performed to ensure that a software application meets specified requirements and behaves as expected. These checks verify whether the output of a function or the state of the application aligns with the intended design and user requirements.

Validation can include:

- **Functional Validation:** Ensuring that features work as intended.
- **Boundary Checks:** Testing the limits of input values.
- **Business Rule Validation:** Confirming that the application adheres to defined business rules.

Regression Testing: Regression testing is performed to confirm that recent changes or enhancements in the software do not adversely affect existing functionality. The goal is to detect any regressions (i.e., unintended side effects) introduced by new code changes. This is typically done by rerunning previously executed tests and ensuring that they still pass.

Implementation

1. Create a TestNG test class to validate a www.google.com. Validate the page title using Assertions.

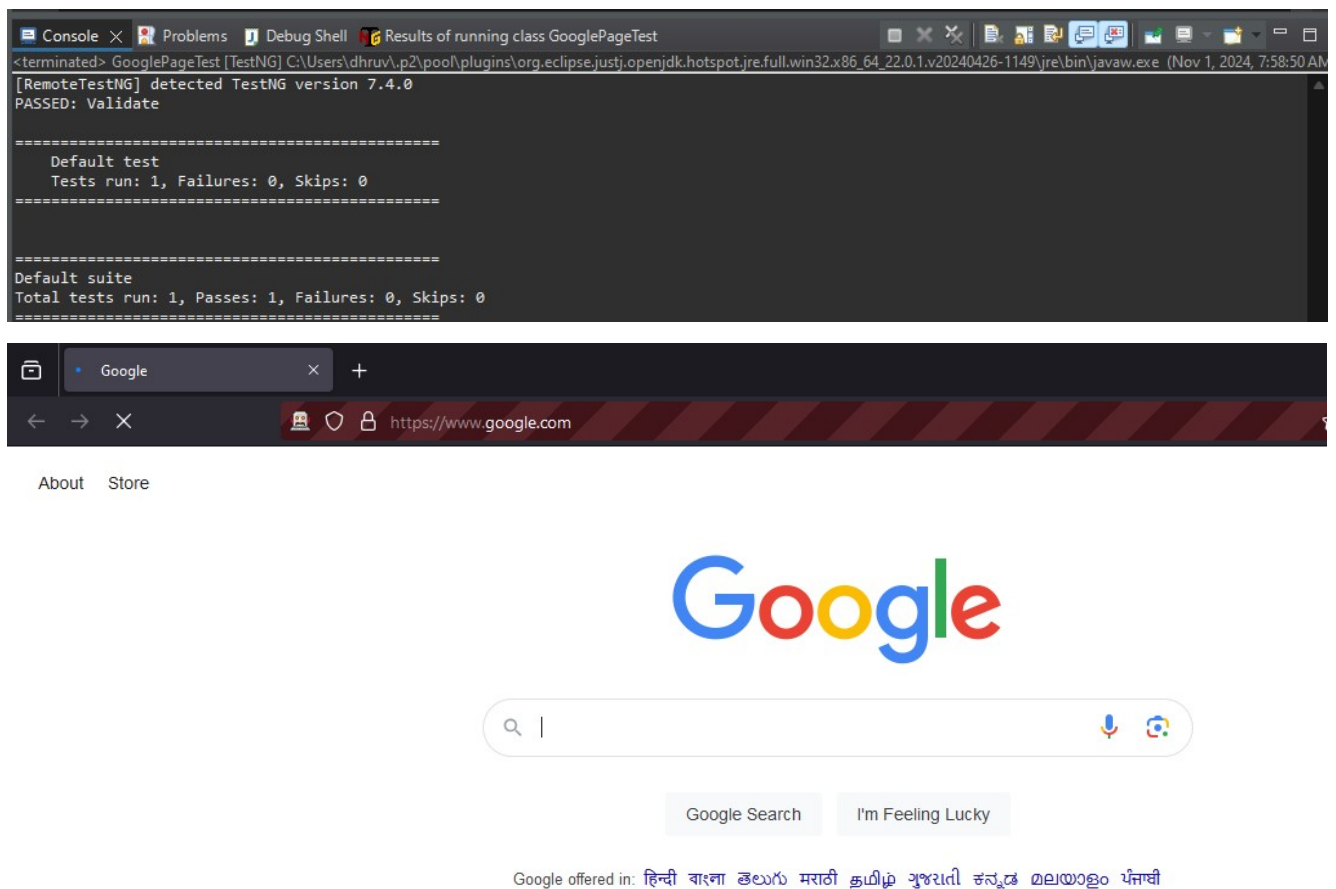

GooglePageTest.java:

```
package demo;

import org.testng.annotations.Test;
import org.testng.annotations.BeforeClass;
import org.openqa.selenium.WebDriver;
import org.openqa.selenium.firefox.FirefoxDriver;
import org.testng.Assert;
import org.testng.annotations.AfterSuite;
```

```
public class GooglePageTest {  
    WebDriver driver;  
  
    @Test  
    public void Validate() {  
        String expectedTitle = "Google";  
        String actualTitle = driver.getTitle();  
  
        Assert.assertEquals(expectedTitle,actualTitle,"Page recived is not expected");  
    }  
  
    @BeforeClass  
    public void beforeClass() {  
        System.setProperty("webdriver.gecko.driver",  
"D:\\Applications\\Selenium_Setup\\geckodriver.exe");  
        // create web driver instance  
        driver = new FirefoxDriver();  
  
        driver.get("https://www.google.com");  
    }  
  
    @AfterSuite  
    public void tearDown() throws InterruptedException {  
        Thread.sleep(3000);  
        if(driver != null) {  
            driver.quit();  
        }  
    }  
  
}
```

Output:

2. You have an existing suite of tests for an New Tour application (<https://demo.guru99.com/test/newtours/>). After a recent update, you need to implement regression tests to ensure that the login process continues to work as expected.

RegressionTest.java:

```
package demo;

import org.openqa.selenium.By;
import org.openqa.selenium.WebDriver;
import org.openqa.selenium.WebElement;
import org.openqa.selenium.firefox.FirefoxDriver;
import org.testng.Assert;
import org.testng.annotations.AfterSuite;
```

```
import org.testng.annotations.BeforeTest;
import org.testng.annotations.Test;

public class RegressionTest {
    WebDriver driver;

    @BeforeTest
    public void setup() {
        System.setProperty("webdriver.gecko.driver",
            "D:\\Applications\\Selenium_Setup\\geckodriver.exe");
        // create web driver instance
        driver = new FirefoxDriver();
        driver.manage().window().maximize();

        driver.get("https://demo.guru99.com/test/newtours/");
    }

    @Test(priority = 1, groups = {"regression"})
    public void verifyTitle() {
        String pageTitle = driver.getTitle();
        Assert.assertEquals(pageTitle, "Welcome: Mercury Tours", "Page Title dosen't match");
    }

    @Test(priority = 2, groups = {"regression"})
    public void verifyLogin() {
        WebElement username = driver.findElement(By.name("userName"));
        username.sendKeys("mercury");

        WebElement password = driver.findElement(By.name("password"));
        password.sendKeys("mercury");

        WebElement submit = driver.findElement(By.name("submit"));
```

```
        submit.click();
    }

    @AfterSuite
    public void tearDown() {
        if(driver != null) {
            driver.quit();
        }
    }
}
```

Testng-regression.xml:

```
<suite name="Regression Suite">
    <test name="Regression Test">
        <classes>
            <class name="demo.RegressionTest"/>
        </classes>
    </test>
</suite>
```

Regression.bat:

```
cd D:\SyMCA Sem3\SoftwareQualityAssurance\TestNG
java -cp "bin;D:\Applications\Selenium_Setup\Selenium/*" org.testng.TestNG testng-
regression.xml
Pause
```

Output:

Featured Destination

ARUBA

This island is surrounded by coral reefs, offers guaranteed sunshine and is blessed with beautiful beaches. Luxury resorts have taken up residence along most of the beachfronts on the southern coast, but there are still undeveloped areas on the exposed northern coast, and much of the interior is inhabited by nothing more substantial than goats.

```

Conclusion: Learned to perform validation checks and regression testing

After performing this Practical/lab, students are expected to answer following questions

Q.1 What are Assertions?

Q.2 What is the need of Regression Testing?
